Clickup Evidence

Team: The larpers
Members: Adi Tauqir, Wilder Edwards

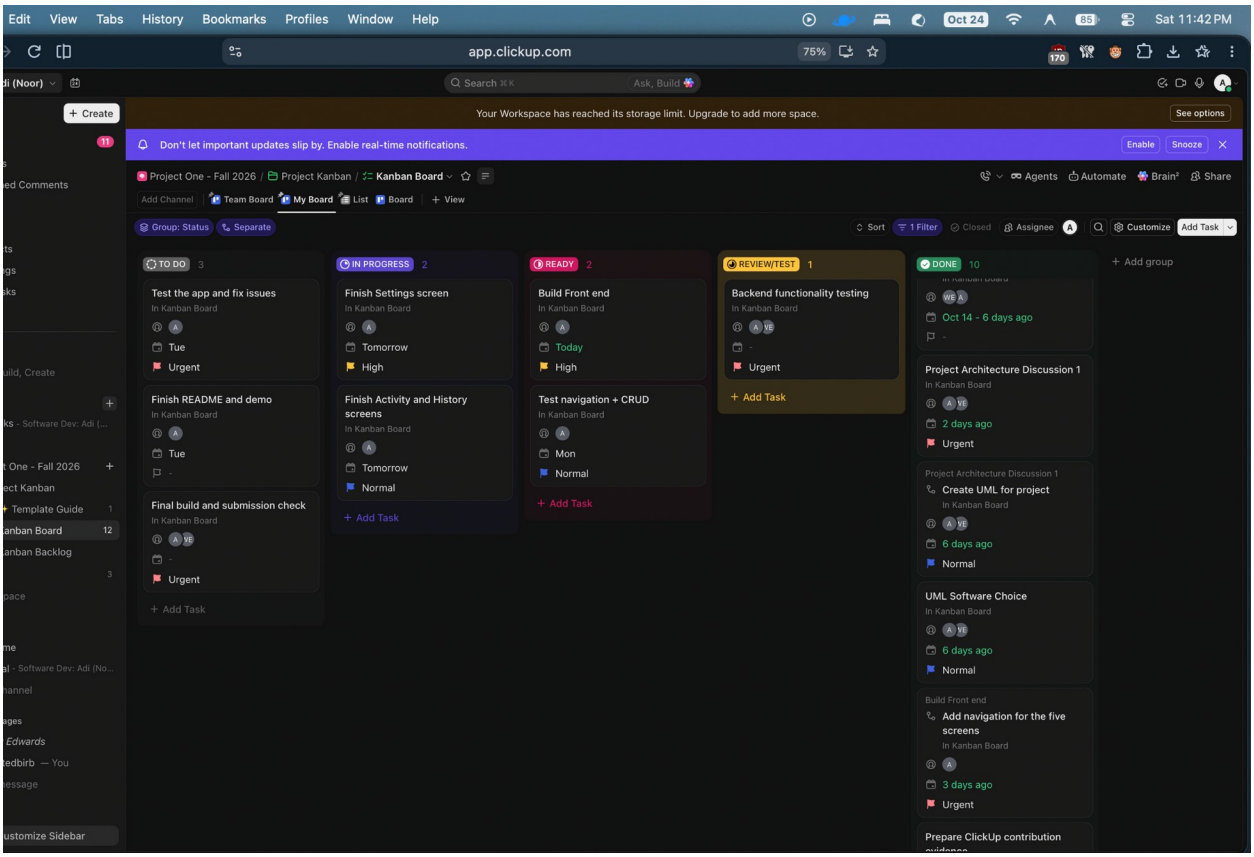

Board policies

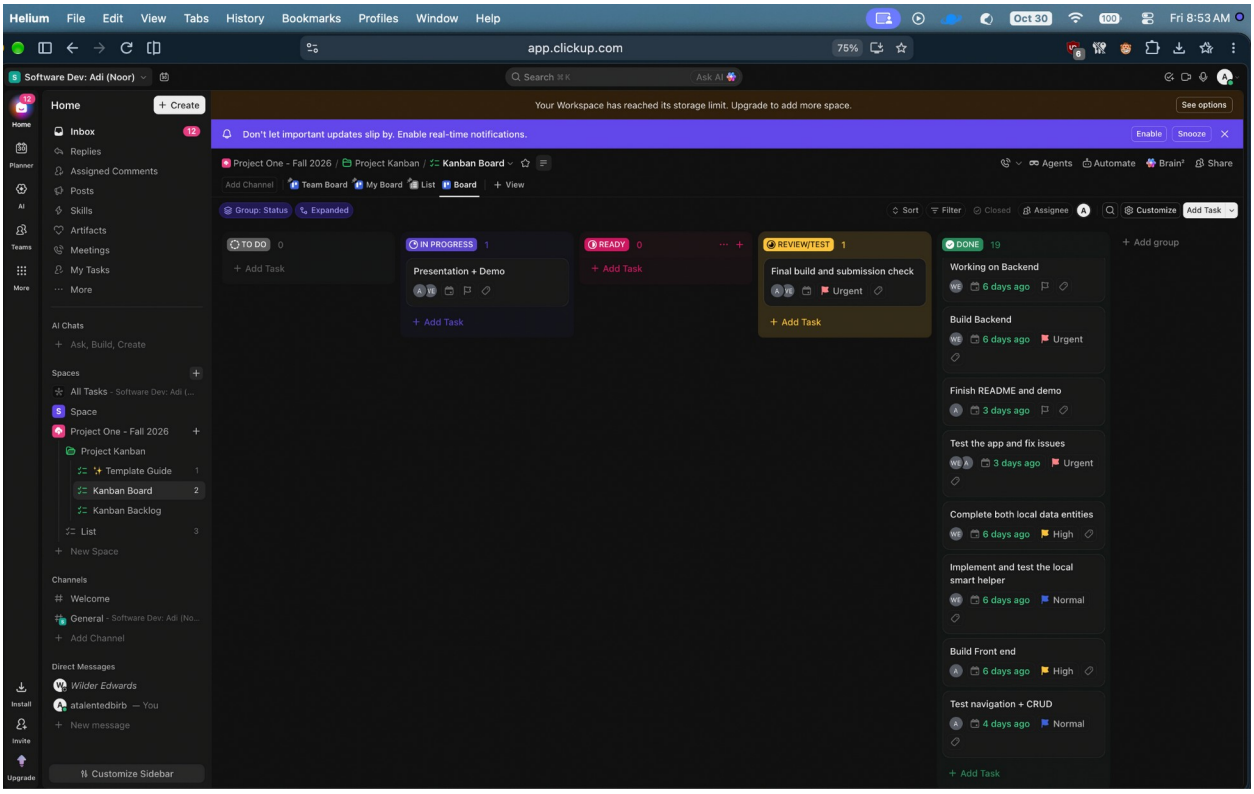

We used To Do, In Progress, Ready, Review/Test, and Done to keep track of our work. Before moving a task to Done, we checked the initial demo and made sure the changes worked with the rest of the app. For backend work, this included checking that the data and front end could work together.

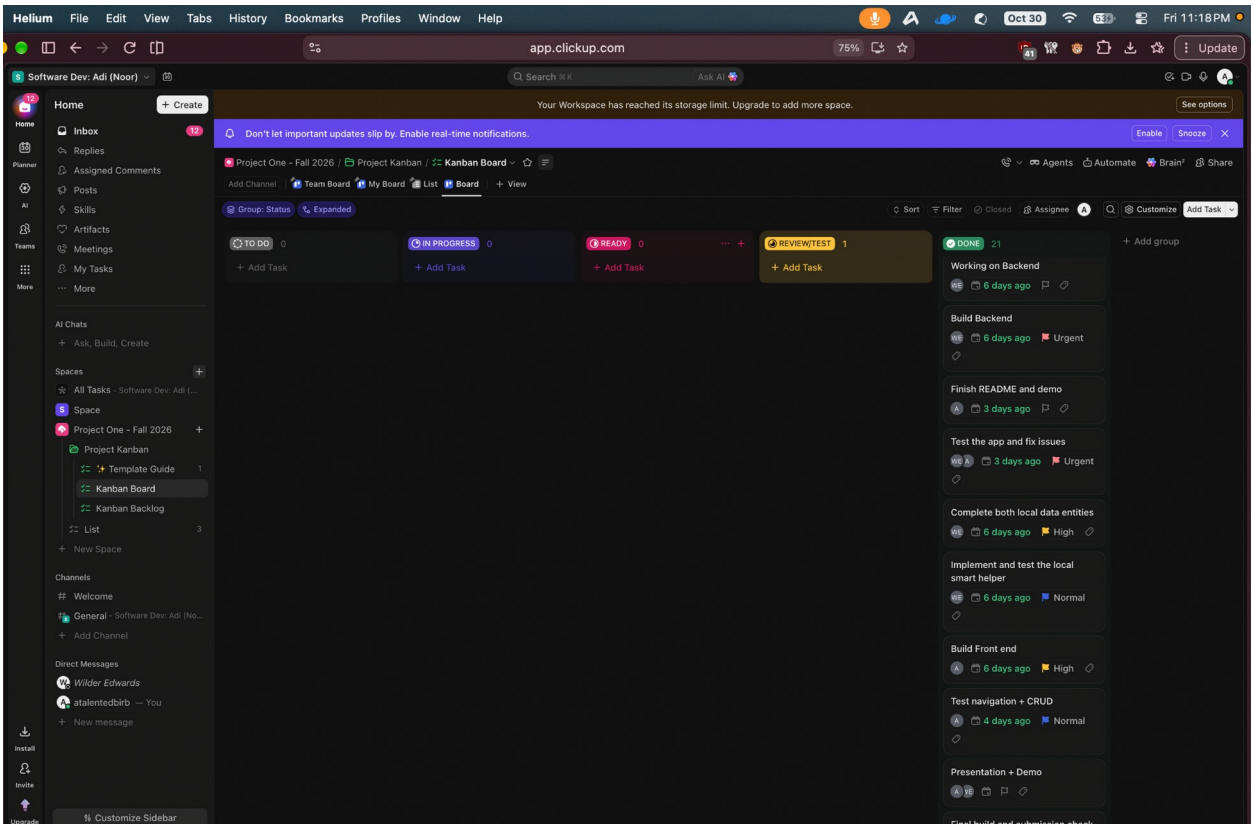

Task - Code/test trace

Adi (Front end): Adi worked on the app screens and how we move between them. In commit 94ad91e, she updated the routes and theme in lib/main.dart. We checked it by opening the app and going through all five screens. We also tried saving a purchase without a price to see if the error showed up.

Wilder (Backend): Wilder worked on saving the data and making sure purchases stay safe. In commit 980d899, they updated lib/data/app_database.dart to stop a meal from being deleted while it still has receipts linked to it. This was part of the work merged in pull request #1. To check it, try deleting a meal that has a purchase and see that the receipt stays.

Project One - Fall 2026 / Project Kanban / Kanban Board
TO DO 3
Test the app and fix issues
Finish README and demo
Final build and submission check
IN PROGRESS 2
Finish Settings screen
Finish Activity and History screens
READY 2
Build Front end
Test navigation + CRUD
REVIEW/TEST 1
Backend functionality testing
DONE 10
Project Architecture Discussion 1
Create UML for project
UML Software Choice
Add navigation for the five screens
Prepare ClickUp contribution

Project One - Fall 2026 / Project Kanban / Kanban Board
TO DO 0
IN PROGRESS 1
Presentation + Demo
READY 0
REVIEW/TEST 1
Final build and submission check
DONE 19
Working on Backend
Build Backend
Finish README and demo
Test the app and fix issues
Complete both local data entities
Implement and test the local smart helper
Build Front end
Test navigation + CRUD

Flow reflection

The board helped us see what each person was working on and track tasks alongside the GitHub work. We worked closely when connecting the front end and backend, but making sure the screens and data worked together took extra time.

Our Git history shows that we merged Adi's work into main before Wilder's requirements branch was merged. Next time, we would start separate branches from main and work on them at the same time. We would agree on the data interfaces early, then review and merge each branch as it is ready.
